Language Variety

The fact that English has been spoken in England for 1,500 years but in Australia for only 200, explains (1) _____ we have a great wealth of regional dialects in England that is more or less totally lacking in Australia. It is often possible to tell where an English person comes from to (2) _____ about 15 miles or less. In Australia, where (3) _____ has not been enough time for changes to bring about (4) _____ regional variation, it is almost impossible to tell where someone comes from at (5) _____, although very small differences are now beginning to appear. It is unlikely, however that there will (6) _____ be as much dialectal variation in Australia as there is in England. This is because modern transport and communication conditions are very different from (7) _____ they were 1,500 or (8) _____ 100 years ago. Even (9) _____ English is now spoken in many different parts of the world many thousands of miles apart, it is very unlikely that English will ever break up into (10) _____ number of different non-intelligible languages in the same way that Indo-European and Germanic (11) _____ German and Norwegian became different languages because the ancestors of the speakers of these two languages moved apart geographically, and were no (12) _____ in touch and communicating with one another. In the modern world, barring unforeseen catastrophes, (13) _____ will not happen, at (14) _____ in the near future. As long as Americans and British people, for instance, are in touch with one another and want to communicate with one another, it is most unlikely that their dialects (15) _____ drift so far apart (16) _____ to become different languages.

Чтение для МГИМО · Set 1

All mammals feed their young. Beluga whale mothers, for example, nurse their calves for some twenty months, until they are about to give birth again and their young are able to find their own food. The behavior of feeding of the young is built into the reproductive system. It is a nonelective part of parental care and the defining feature of a mammal, the most important thing that mammals-- whether marsupials, platypuses, spiny anteaters, or placental mammals -- have in common.

But not all animal parents, even those that tend their offspring to the point of hatching or birth, feed their young. Most egg-guarding fish do not, for the simple reason that their young are so much smaller than the parents and eat food that is also much smaller than the food eaten by adults. In reptiles, the crocodile mother protects her young after they have hatched and takes them down to the water, where they will find food, but she does not actually feed them. Few insects feed their young after hatching, but some make other arrangement, provisioning their cells and nests with caterpillars and spiders that they have paralyzed with their venom and stored in a state of suspended animation so that their larvae might have a supply of fresh food when they hatch.

For animals other than mammals, then, feeding is not intrinsic to parental care. Animals add it to their reproductive strategies to give them an edge in their lifelong quest for descendants. The most vulnerable moment in any animal's life is when it first finds itself completely on its own, when it must forage and fend for itself. Feeding postpones that moment until a young animal has grown to such a size that it is better able to cope. Young that are fed by their parents become nutritionally independent at a much greater fraction of their full adult size. And in the meantime those young are shielded against the vagaries of fluctuating of difficult-to-find supplies. Once a species does take the step of feeding its young, the young become totally dependent on the extra effort. If both parents are removed, the young generally do no survive.

1. What does the passage mainly discuss?

- A) The care that various animals give to their offspring.
- B) The difficulties young animals face in obtaining food.
- C) The methods that mammals use to nurse their young.
- D) The importance among young mammals of becoming independent.

2. The author lists various animals in line 5 to

- A) contrast the feeding habits of different types of mammals
- B) describe the process by which mammals came to be defined
- C) emphasize the point that every type of mammal feeds its own young
- D) explain why a particular feature of mammals is nonelective

3. The word “tend” in line 7 is closest in meaning to

- A) sit on
- B) move
- C) notice
- D) care for

4. What can be inferred from the passage about the practice of animal parents feeding their young?

- A) It is unknown among fish.
- B) It is unrelated to the size of the young.
- C) It is dangerous for the parents.
- D) It is most common among mammals.
